

Authentic human data for C₆–C₅ metabolites in urine, plasma, ileal fluid and feces

Gary Williamson¹ and Michael N. Clifford^{1,2}

Author Williamson ORCID 0000-0002-5624-6267 is with the Department of Nutrition, Dietetics and Food, Victorian Heart Institute, Faculty of Medicine Nursing and Health Sciences, Monash University, Victoria Heart Hospital, 631 Blackburn Road, Clayton, VIC 3168 Australia.

Author Clifford ORCID 0000-0002-4204-5720 is with the School of Bioscience and Medicine, Faculty of Health and Medical Sciences, University of Surrey, Guildford GU2 7XH, Surrey, UK and is Adjunct Professor with the Department of Nutrition, Dietetics and Food, Victorian Heart Institute, Faculty of Medicine Nursing and Health Sciences, Monash University, Victoria Heart Hospital, 631 Blackburn Road, Clayton, VIC 3168 Australia.

Introduction

This document is a compilation of published quantitative data obtained with authentic calibrants for the concentrations of C₆–C₅ metabolites (i.e. 5-phenylvaleric acids, 4-hydroxy-5-hydroxyphenylvaleric acids, phenylvalerolactones and the associated phase-2 conjugates) in human urine, plasma, ileal fluid and feces. The originating publications were identified by searching Web of Science, PubMed and Google Scholar up to May 2024.

Data originally reported on a mass/day or mass/volume basis have been converted to a molar basis to facilitate comparisons, but some published data were excluded from these tables:

- (i) Data originally reported relative to creatinine, the standard clinical practice with spot plasma and urine samples, cannot be accurately converted to a molar basis because creatinine production varies with sex, age and protein intake.
- (ii) Data produced by acid or enzymic hydrolysis of phase-2 conjugates have not been tabulated except for glycine or glutamine conjugates when β -glucuronidase and sulfatase hydrolysis has been used.

Similar compilations have been prepared for C₆-C₁ metabolites (benzoic acids), C₆-C₂ metabolites (phenylacetic acids) and C₆-C₃ metabolites (3-phenylpropanoic acids and cinnamic acids) and the metabolites have been identified using the nomenclature recommended by Kay *et al.* (Kay et al. 2020) and are numbered consecutively in a single series through the five documents.

Free-living Plasma spot value	Feeding Study Plasma C _{max}	Feeding Study Urine	Washout				Fecal water	Ileal fluid	Notes	Reference	N
